Hypothermia Can Be Prevented

① Close all 4 passages for Heat Loss

Evaporation

When moisture evaporates, it takes your heat away!

Do not get wet in the first place. If so, dry and change your clothes. If not, tightly package yourself with a warm tarp, etc.

Convection

Wind takes your heat away!

Make an outer shell with a tarp, so that the air does not touch your body directly.

Conduction

Direct contact to the ground, rocks or cemented surface takes your heat away!

When lying down, place a foam mattress or layers of cardboard underneath. (minimize the area of contact & maximize insulation)

Radiation

Your body dissipates heat!

Wrap your body with Emergency sheet or blanket which helps prevent radiative cooling.

It's better to put external heat source (hot water bottle, etc.) inside the blanket.

The front of this package is not closed in order to show the inner layers. Minimize the open area only to the face.

② Get calories onboard !

Hydration + Foods (simple sugar / carbohydrate / protein / fat). Once warmed enough, keep adding fat to help stay warm.

Alert: Do not give any foods patient has allergy to.

③ Uncontrollable Shivering with Drowsiness; Call#119 !
